Sam J., 32

Medical Lab Technician - Primary User

Background

Sam is a certified lab technician who has worked at a regional outpatient clinic for six years. She processes between 30 and 60 samples per shift. Her lab currently uses a shared Excel spreadsheet and paper route sheets to manage everything.

Quick Facts

Age	32
Education	Associate degree in Clinical Laboratory Science
Tech Comfort	Moderate and comfortable with computers, not technical
Currently Uses	Shared spreadsheets and paper sample logs

Goals

- Register samples quickly without interrupting her testing workflow
- See the status of every sample without digging through a spreadsheet
- Get an immediate alert when a test result is outside the normal range

Current Issues

- Paper logs get messy when multiple people update the spreadsheet at the same time
- No automatic flag when a result is abnormal and she has to catch it herself
- Finding an old sample record takes several minutes and sometimes cannot be found at all

How LabTrack Helps

Sam can register a sample in under a minute, update its status with one click, enter the result, and immediately see a system-generated HIGH / LOW / NORMAL flag. No paper, no manual judgment call.

Dr. Peter K., 47

Laboratory Director · Secondary User

Background

Dr. Peter has directed a 12-person diagnostic lab for over a decade. He oversees four technicians and is responsible for quality assurance and clinical reporting. He currently receives a printed end-of-day summary from his lead technician and has no real-time view of the lab during the day.

Quick Facts

Age	47
Education	PhD in Clinical Pathology
Tech Comfort	Moderate and comfortable with dashboards and reports
Currently Uses	End-of-day printed summaries and phone calls to staff

Goals

- See a live snapshot of how many samples are pending, in progress, and completed
- Know immediately when any abnormal or critical result has been recorded
- Confirm at end of shift that all samples have been processed and closed

Current Issues

- By the time he gets the paper summary, critical results may have been unreviewed for hours
- To check lab status, he has to call or walk over and interrupt a technician
- No searchable audit trail and looking up an old sample means hunting through binders

How LabTrack Helps

Dr. Peter can check the live dashboard at any point during the day and immediately see pending counts, completed counts, and any flagged abnormal results and all without asking anyone.
